

This is just an on/off switch for the TMCC or Legacy ground wire connection.

I found that I had to switch the power lead going to my Legacy unit because the ground wire ran with the bundle of track wiring and caused a small induction of the signal. If you use the power lead from the wall transformer to the TMCC or Legacy unit just cut one side and connect it through the toggle switch.

Below is the drawing for using the ground wire from the TMCC or Legacy base unit to turn the digital signal on or off.
